

Patient-Centric Rating & Evaluation Platform
for Healthcare Providers

DRAPO

A Flutter + Firebase mobile app turning real post-visit experience into transparent, server-validated, weighted provider rankings. A decision-support tool — **not** a medical record.

Patients

Search, compare, save & review providers; add off-app doctors via Community.

Providers

Claim a profile, track rating trends, reply to patient reviews.

Admins

Moderate data, approve practice changes, uphold provider quality.

01 Objective

Close the healthcare information gap.

Turn scattered post-visit experience into structured, comparable rankings for doctors, pharmacies & clinics. DRAPO stores **no** diagnoses, prescriptions, or treatment history — it measures non-clinical service quality only, aligned with UN SDG 3.

02 Architecture

PRESENT.	Flutter UI — auth, discovery, profiles, questionnaire, dashboards
SERVICE	provider state — auth, search, review & community management
LOGIC	AHP ranking · validation · A/B assignment · SUS scoring
CLOUD	Firebase Auth · Firestore · Cloud Functions v2 · Storage

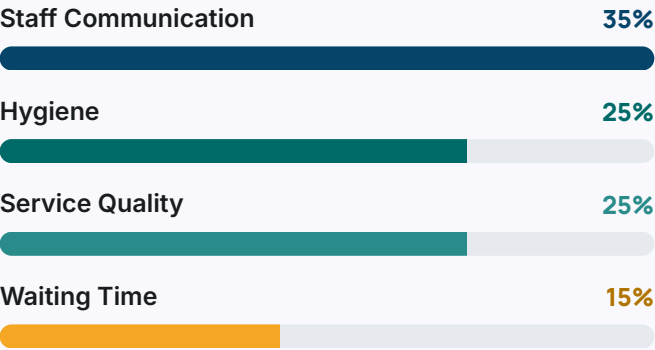

Server-side integrity — reviews are immutable, keyed `uid_providerId` (one per patient/provider). A Cloud Function recomputes provider scores on every write, so clients can't fake rankings.

- usersprovidersreviews
- community_doctorscommunity_reviews

Privacy — KVKK-aware data minimization, role-aware access, anonymous reviews, no clinical records.

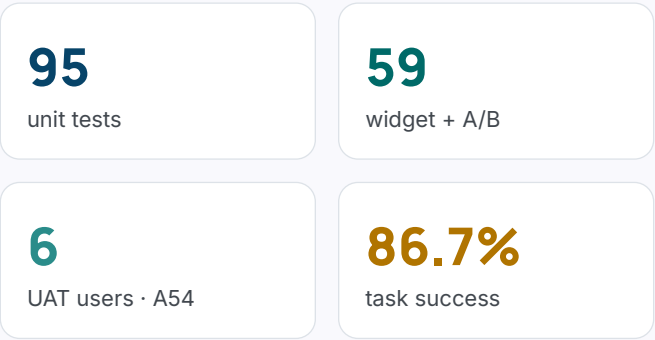

03 AHP-inspired ranking

score = 0.4 × rating + 0.6 × weighted questionnaire

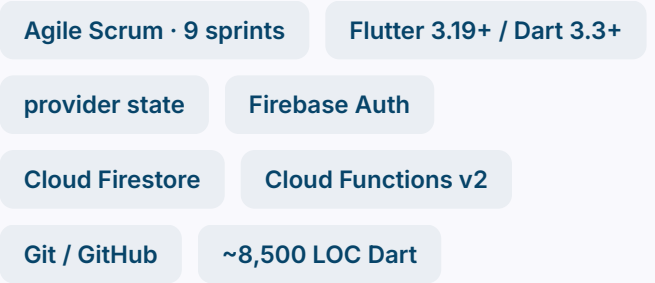

Weights derived from pairwise comparison; recomputed per provider on every review write.

04 Verification

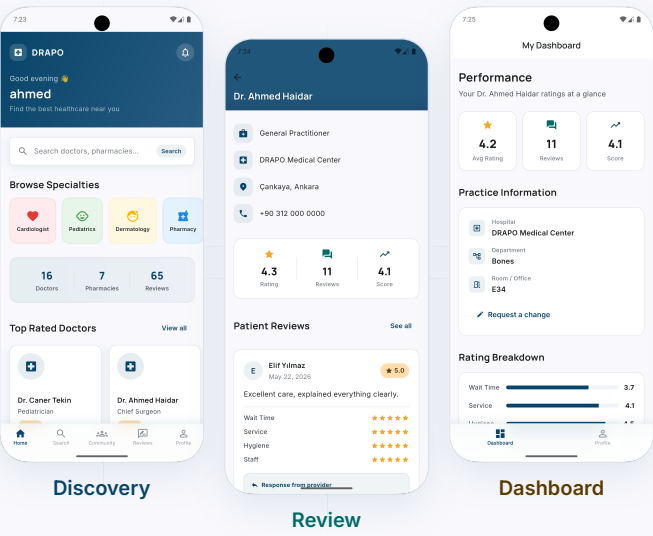

A/B "Stats Bar Visibility" with deterministic 50/50 split. SUS **78.75** beats industry (68) & healthcare-app (71.4) averages.

05 Methods & tools

06 Interfaces

Role-aware login · search by name, specialty, category & location · structured review with stars, four criteria & anonymity · provider analytics · admin moderation · community off-app doctors.

07 Conclusion

A working, server-validated platform that makes non-clinical healthcare quality comparable and actionable. Patients gain evidence to choose; providers gain feedback to improve.

Next — appointments, AI fraud detection, advanced analytics, larger provider database, second SUS round.
